Software Dependability - UNISA - February 2024. Prof. Dario Di Nucci

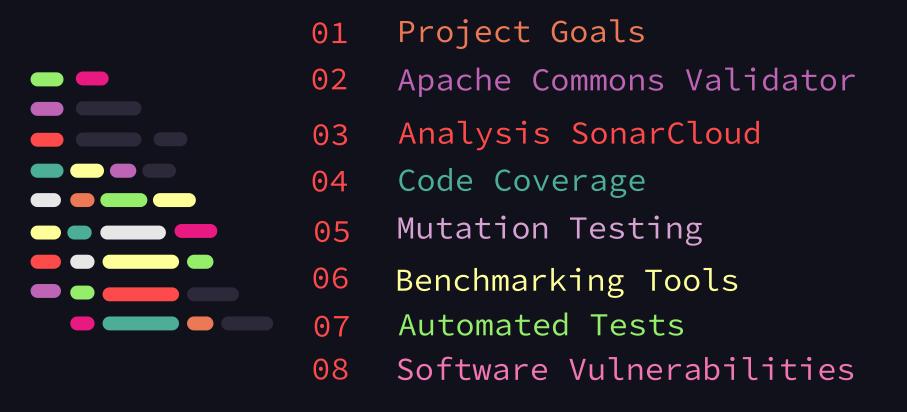

Apache Commons Validator Library

Software Dependability Analysis

Katia Melanie Perchet

Content

Project Goals

It is aim to provide a comprehensive evaluation of the Apache Commons Validator library's dependability, addressing aspects of code quality, test coverage, security, and performance.

Apache Commons Validator

Is an open-source Java library which provides the ability to verify the integrity of incoming data, both client-side and serverside.

SonarCloud Analysis

Issues

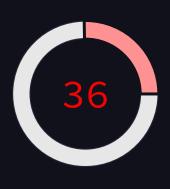

After a thorough analysis of the project, the report revealed an extensible list of issues.

Issues Found

HIGH

- Clone methods
- Serializable or transient variables
- Empty methods
- Absence of assertions in tests

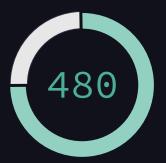

MEDIUM

- Extensive ReGex
- Nested try-catch Inappropriate
 constructor's

visibility

Wrong of method arguments

LOW

- Deprecated and commented code.
- Singleton Pattern
- Boolean literals
- Public modifiersin Tests

Issues Fixed

Addressed the majority of issues, of which four of the bugs were fixed and five hundred and fifty-one code smells

JaCoCo

It generated comprehensive report that points to specific sections of the code exercised by the tests.

Report

Mutation Testing

PiTest

It aims to enhance test adequacy and pinpoint defects within the codebase by revealing weaknesses in test coverage.

Report

Benchmarking Tools

Java Microbenchmarking Harness (JMH)

Tool designed for the precise and dependable benchmarking of Java code, facilitating accurate measurement and analysis within a controlled and well-defined framework.

Benchmark	Mode	Cnt	Score	Error	Units
BenchmarkRunner.testIsValid1Benchmark	thrpt	25	336728.518	± 12381.527	ops/s
BenchmarkRunner.testIsValid2Benchmark	thrpt	25	59810.182	± 3980.859	ops/s
${\tt BenchmarkRunner.testIsValidAuth1Benchmark}$	thrpt	25	402688.222	± 14788.048	ops/s
BenchmarkRunner.testIsValidAuth2Benchmark	thrpt	25	60322.020	± 2688.195	ops/s
Process finished with exit code 0					

Automated Testing Generation

EvoSuite

Generated test suites with two primary goals: maximizing a specified coverage criterion and minimizing the suite's size in terms of the number of tests and statements.

Results

This process resulted in the creation of 129 new tests for enhanced code coverage. Each class was equipped with two types of tests: the primary test and accompanying scaffolding classes.

Software Vulnerabilities

FindSecBugs

Automated security analysis tool, leveraging its capabilities to scrutinize Java code comprehensively.

Conclusion

Adopting these practices as part of a continuous improvement strategy will fortify the existing project and promote a culture of excellence and resilience in software engineering.

Thank you.
